

# ITP2200

# Introduction to Software Testing

**Bogdan Marculescu**

# Lecture 9

## Testing for Different Technologies

# So, more programming this week?

# What do we remember from last time(s)?

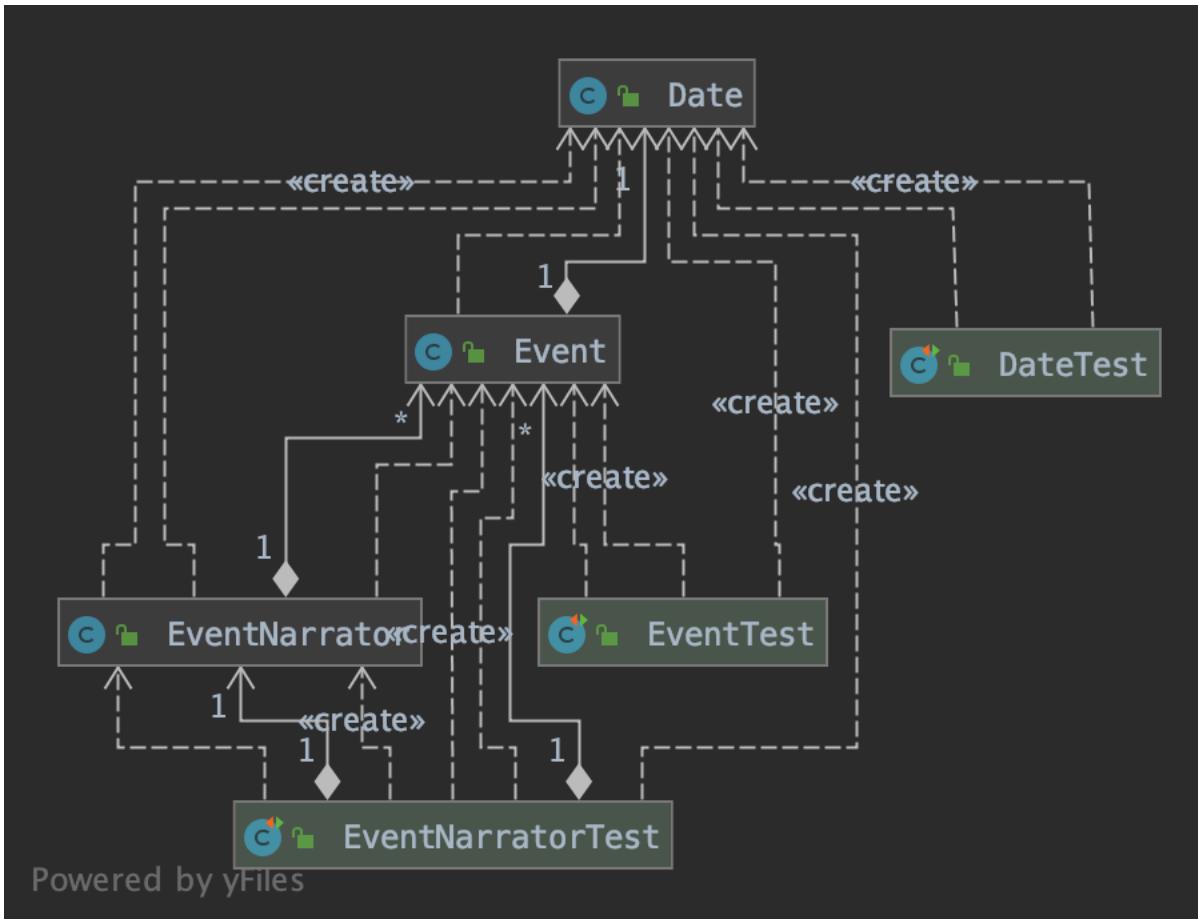

# Software Development Process

Quick primer on how software development works:

1. Requirements analysis and specification
2. System and software design
3. Intermediate design
4. Detailed design
5. Implementation
6. Integration
7. System deployment
8. Operation and maintenance

# Object Oriented

This is familiar!

**Unit Tests** – at the method and Class level

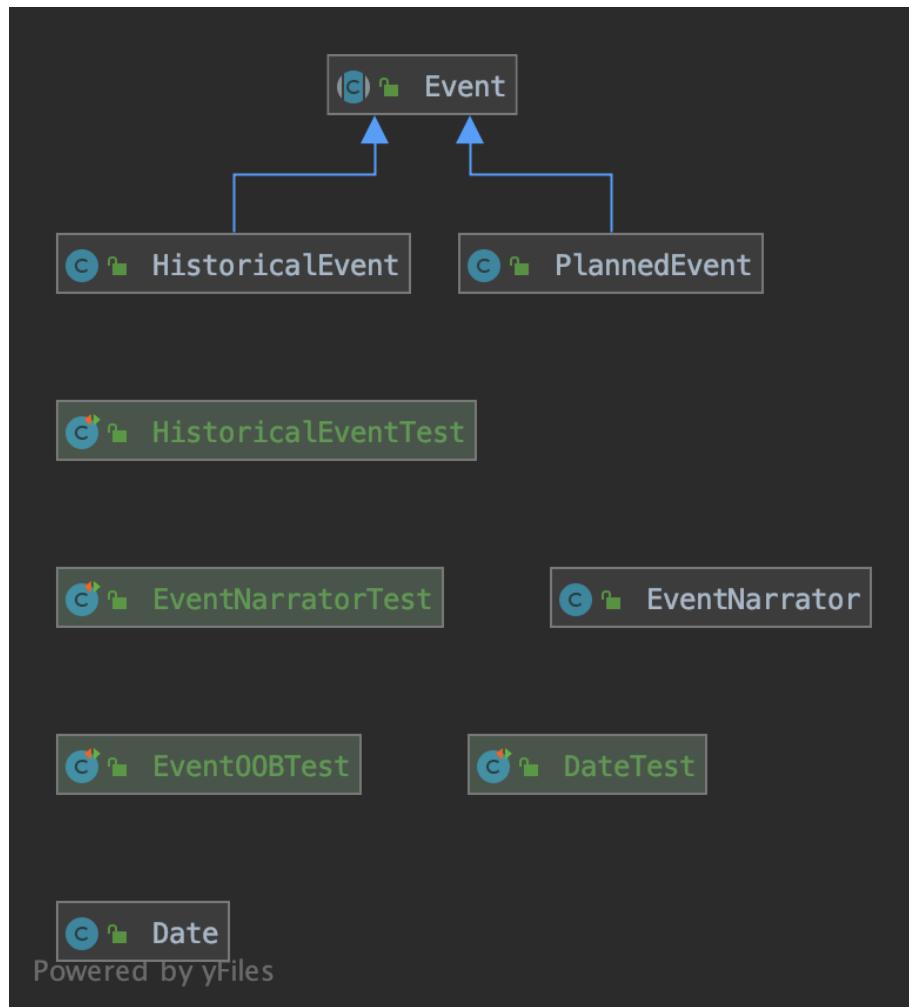

**Integration Tests** – building modules

**Regression Tests** – Re-running old tests to verify new changes

All clear, right?

Who's wondering what the catch is?

# Object Oriented

The catch(es):

- **Polymorphism** – how do we test when several classes have the same methods?
- **Complexity** – each method should be tested individually and in combination
  - each class should be tested individually and in combination

# Object Oriented

Extra catch:

- **Dynamic binding** – exactly what class, what implementation, what methods and variables are available can change at runtime
- **Inheritance** - overriding methods with different semantics
  - different accessibility of variables

```
private Event[] sillyInit(){  
    return new Event[]{new HistoricalEvent( name: "Midway", n  
    new HistoricalEvent( name: "Death of Caligula", n  
    new HistoricalEvent( name: "Reign of Aurelian", n  
    new HistoricalEvent( name: "New Year's Party", ne  
    new HistoricalEvent( name: "Online lecture due to Da  
    new PlannedEvent( name: "Summer holidays", new Da
```

# Object Oriented

```
//fires the appear event when appropriate
var check = function() {
    //is the element hidden?
    if (!t.is(':visible')) {
        //it became hidden
        t.appeared = false;
        return;
    }

    //is the element inside the visible window?
    var a = w.scrollLeft();
    var b = w.scrollTop();
    var o = t.offset();
    var x = o.left;
    var y = o.top;

    var ax = settings.accX;
    var ay = settings.accY;
    var th = t.height();
    var wh = w.height();
    var tw = t.width();
    var ww = w.width();

    if (y + th + ay >= b &&
        y <= b + wh + ay &&
        x + tw + ax >= a &&
        x <= a + ww + ax) {
        //trigger the custom event
        if (!t.appeared) t.trigger('appear', settings.data);
    } else {
        //it scrolled out of view
        t.appeared = false;
    }
};

//create a modified fn with some additional logic
var modifiedFn = function() {
    //mark the element as visible
    t.appeared = true;
    //is this supposed to happen only once?
    if (settings.one) {
        //remove the check
        w.unbind('scroll', check);
        var i = $.inArray(check, $fn.appear.checks);
        if (i >= 0) $fn.appear.checks.splice(i, 1);
    }
    //trigger the original fn
    fn.apply(this, arguments);
};

//bind the modified fn to the element
if (settings.one) t.one('appear', settings.data, modifiedFn);

```

Managing complexity:

- Data flow
- Coupling

Concepts are used in analysing and testing such code.

Clear understanding of design helps.  
Clear design also helps.

Questions so far?

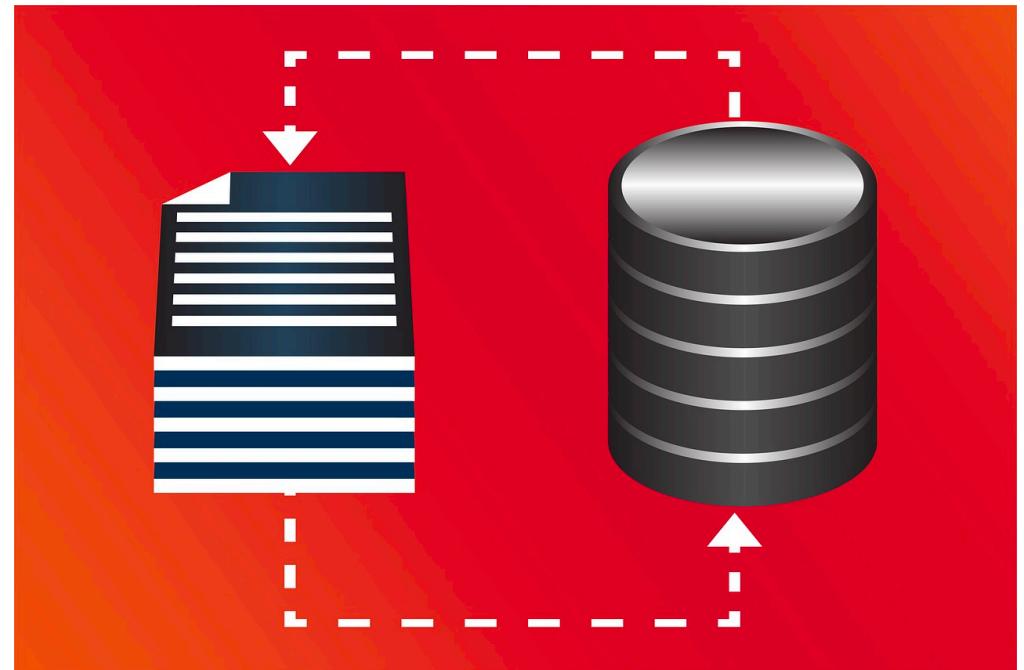

---

# Web Apps and Web Services

Online apps:

- Websites – html
- Dynamic web applications –javascript
- Web services – Java, Kotlin, etc.

Often, following a RESTful approach.

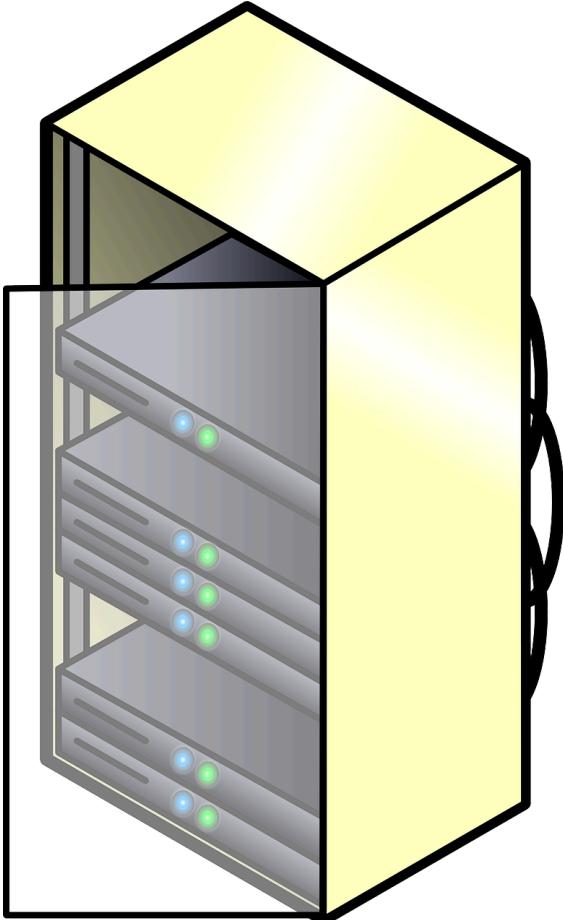

# Web Apps and Web Services

Websites and  
client side of dynamic web applications

- Validity of links
- Displayed pages and accessibility
- Security
- Performance
- Often involves subjective components

# Web Apps and Web Services

Web services and  
The server side of web applications

- Often through HTTP (stateless transfer)
- Often RESTful (at the time of writing)
- Focused on accessing the system via endpoints
- Include service finding, mocking, stubs
  
- Book mentions SOAP and WSDL
- Now it's more JSON and OpenAPI

Høyskolen  
Kristiania

Questions so far?

---

# Graphical User Interfaces

Focus on:

- User experience, user behaviour
- Capture-replay known behaviours
- Old friends: graphs and finite state machines

# Real-time and Embedded Systems

Focus on:

- Observability and reproducibility
- Probe effect (the measurement itself has an impact)
- More focus on timeliness (and strict enforcement of timing constraints).

Questions so far?

---

# Exercise for the Seminar

## Online!

- Two submissions
- Good first step. Now, let's go into detail.
- How can we ensure each requirement is met?
- Are there any changes you feel should be made to the requirements/design
- What bugs did you find and how would you report them?

# Exercise for the Seminar

## Online!

- Put together a **test plan** for our Narrator
- Focus on the motivation, link the requirements to a clear plan for testing
- Also have tests that are in line with your plan
- End with a section about what is missing, and what should be done next
- Send me the document for comments and feedback (not grades!)
